## Problem Set 6

### (Absorption & Stripping)

1. We are absorbing hydrogen sulphide ( $\text{H}_2\text{S}$ ) in biogas at  $15^\circ\text{C}$  into water. The entering water is pure. The feed gas contains 0.0012 mole fraction  $\text{H}_2\text{S}$  and the remaining  $\text{CH}_4$ , and we want to remove 97 mol% of  $\text{H}_2\text{S}$  in biogas into water. The gas flow rate is 10 kmol/h, while the liquid flow rate is 2,000 kmol/h. Total pressure is 2.5 atm. The equilibrium data is

$$\text{Partial pressure of } \text{H}_2\text{S (atm)} = (\text{Henry's constant})x$$

where Henry's constant of  $\text{H}_2\text{S}$  in water at  $15^\circ\text{C}$  is 423 atm/(mole fraction) and  $x$  is mole fraction of  $\text{H}_2\text{S}$ .

1.1) Calculate the outlet gas and liquid mole fraction of  $\text{H}_2\text{S}$

1.2) Calculate the number of equilibrium stages required, using a McCabe-Thiele diagram

1.3) If actual  $\frac{L}{V} = m \left( \frac{L}{V} \right)_{\min}$ , find the value of  $m$  (a multiplier)

2. We wish to design a stripping column to remove carbon dioxide ( $\text{CO}_2$ ) from water. This can be done by heating the water +  $\text{CO}_2$  mixture and passing it counter-currently with a nitrogen stream in a stripper. The operation is isothermal and isobaric at  $60^\circ\text{C}$  and 1 atm, respectively. The water contains  $9.2 \times 10^{-6}$  mole fraction  $\text{CO}_2$  and flows at 100,000 lb<sub>m</sub>/h. Nitrogen enters the column as pure  $\text{N}_2$  and flows at 2,500 ft<sup>3</sup>/h. Nitrogen is also at 1 atm and  $60^\circ\text{C}$ . We desire an outlet water concentration of  $2 \times 10^{-7}$  mole fraction  $\text{CO}_2$ . Assume that  $\text{N}_2$  is not dissolved in water and that water is not evaporated. The Henry's constant for  $\text{CO}_2$  in water at  $60^\circ\text{C}$  is 3,410 atm/(mole fraction). Find the number of equilibrium stages required.
3. A stripping tower with 4 equilibrium stages is being used to remove ammonia from waste water using air as the stripping gas. The operation is at  $80^\circ\text{F}$  and 1 atm. The inlet air is pure air, and the inlet waste water contains 0.02 mole fraction ammonia. The column operates at  $L/V$  of 0.65. The equilibrium data in mole fraction is given as  $y = 1.414x$ . Find the outlet concentrations.
4. An absorption column for laboratory use has been carefully constructed so that it has exactly 4 equilibrium stages and is being used to measure equilibrium data. Water is used as the solvent to absorb ammonia from air. The system operates isothermally at  $80^\circ\text{F}$  and isobarically at 1 atm. The inlet water is pure distilled water. The ratio of  $L/V$  is 1.2, the inlet gas concentration is 0.01 mole fraction ammonia, and the measured outlet gas concentration is 0.0027 mole fraction ammonia. Assuming the equilibrium is of the equation  $y = mx$ , determine the value of  $m$ .

5. We wish to strip  $\text{CO}_2$  out of water at  $20^\circ\text{C}$  and 2 atm using a staged, counter-current stripper. The liquid flow rate is  $100\text{ kmol/h}$  of water, and the initial  $\text{CO}_2$  mole fraction in water is  $0.00005$ . The inlet air stream contains no  $\text{CO}_2$ . It is desired to obtain  $98.4\%$  removal of  $\text{CO}_2$  from water. The Henry's constant for  $\text{CO}_2$  in water at  $20^\circ\text{C}$  is  $1,420\text{ atm}$ .
- 5.1) Find the outlet  $\text{CO}_2$  mole fraction in water
  - 5.2) Find  $V_{\min}$
  - 5.3) If there are 7 equilibrium stages, find  $V$  and the outlet mole fraction  $\text{CO}_2$  in water
6. We wish to absorb ammonia from air into water. The equilibrium data is given as  $y = 1.414x$  in mole fraction. The counter-current column has 3 equilibrium stages. The entering air stream has a total flow rate of  $10\text{ kmol/h}$  and is with  $0.0083$  mole fraction  $\text{NH}_3$ . The inlet water stream contains  $0.0002$  mole fraction  $\text{NH}_3$ . We desire an outlet gas concentration of  $0.0005$  mole fraction  $\text{NH}_3$ . Find the required liquid flow rate,  $L$ .
